Dear Reader:

Hello my name is Christopher, I am a student at Como Park Elementary, and I am in 6th grade. We are currently learning about Global warming and its effects. I think that Global warming is a serious issue it affects everyone globally. It has caused agriculture and natural disasters and Energy costs are going up at all time high. I believe that Global warming is an Economical Issue that is happening to every one, which is very direct to be all are problems. We are also producing methane and carbon dioxide and nitrous oxide from factories, industries, homes and cars.

If you haven't found out yet that global warming is a 1500-year cycle well you should be glad that you are reading this paper. Because Global warming has caused a lot of things to happen there has been a lot of supply demand when that happens it could cost people who own the stores and how they might have employees that are already making a low wages. Like when there is someone that has a lot of something like food cattle or crops and when there is less of something then there is a demand because they want more when there is less.

Many scientists believe that global warming is human made. The sun is one of the main starters because it has caused at least 20% of Global Warming. It is a 1500-year cycle that cannot be stopped but can be slowed down. But as I know global warming may be natural but we also cause it because we are not thinking of what we are doing on a daily basis. Because of our actions we have caused a lot of things like polluting and hurting our sewer chain to cause an action of events, which cause a lot of problems that can cause another catastrophe, which leads on to an Economic Crisis.

Agriculture to me means to have mess someone's career up or to take over which can be really unfair to do that to someone when they could making a low income and need that second job. Agriculture is when someone is in a position where they can't sell any more of their food or vegetables that they have grown because it is not growing and that could be from a drought or no sun because of the weather. And in the other state there are probably some farmers that are looking for a little more money and they could raise the prices and then if that is the only place that can be bought from then the store will have to raise up the prices on the food because of hat one person in that state .I believe that it isn't fair to take advantage of people and how they have to pay more money because they lost energy in one state then they have to try to budge it out what they are spending a month. We should start trying to do at least one thing to support Global warming because of what is happening like when homes are knocked down in one state citizens would have to pay more in the other state because the bank or the insurance people or loan people would lose their money which is really bad because global warming causes this to happen. Like if the water is warmer than 80 degrees Fahrenheit it will cause the wind that is coming across from the water to pick that water up and cause a massive hurricane. We can make a change. Thank you for your time and have wonderful day .I hope you take these recommendations seriously and I hope you will put this paper in the pioneer press to have the citizens aware of these criteria's.

Cordially,

Christopher
