Dear Reader:

Hi my name is Laesha I am a student at Como Park elementary. I am in sixth grade and we are working on global warming. I am learning about the spread of spread of disease caused by global warming. I think that global warming is caused by humans using too much electricity. I think more people should learn about this issue to understand the dangers of disease. I believe that global warming is making it hard to eat or plant food.

Scientists say that the anopheles mosquitoes carry and give malaria. Many people think that global warming is natural disease is making it harder and harder to get food to eat. If nothing ever changes soon global warming will speed up and diseases will be everywhere.

I think if no one changes and does nothing to help the world the disease will affect all animals and all humans. Yellow fever is a tropic disease it can spread to humans by mosquitoes. Mosquitoes also carry malaria. Global warming is causes disease because when the water will rise and it will attract The mosquitoes will get all these diseases and will spread to humans.

To stop all theses disease causing global warming you should use less electricity and keep animals that are losing their homes and us that are losing our world. Keep the earth green!!!

Thanks for all your precious time for reading my letter. Pleases write back!!!

Sincerely,

Laesha
